You have 46 chromosomes of DNA in each cell. 23 are from your father and 23 from your mother. This gives you 2 copies of each gene. Each nucleotide is composed of a phosphate, pentose sugar and a nitrogenous base DNA is bundled in structures called chromosomes found in the nucleus of every cell.

Biology Study Guides - SparkNotes

DNA is arranged into structures called chromosomes and the chromosomes within a single cell are collectively called the genome. For single celled organisms like bacteria, this genome usually consists of only one chromosome. In more complex organisms, like humans, the genome consists of 46 chromosomes (2 copies of the 22 autosomal chromosomes plus either 2 X chromosomes or 1 X and 1 Y chromosome).

Page 5 AP Biology: 2013 Exam Review. 4. DNA polymerase from *T. aquaticus* (Taq) is used in PCR (polymerase chain reaction). PCR is a technique where millions of copies of DNA can be made from one original copy. In this method, the target DNA molecule is subjected to temperatures over 95 °C to make the double-stranded DNA separate.

The different RNA molecules work to assemble amino acids. DNA provides the instructions for the sequence of amino acids. 5. How are DNA and RNA involved in protein synthesis? The sequence of DNA provides a template that has a coded message on the order of the amino acids. mRNA delivers the instructions from DNA to the ribosome. tRNA brings amino acids.
